

Introduction to COA:

Computer Architecture:

- Deals with **functional behaviour** of Computer Systems.
- **Design Implementation** for the various parts of computer.

Computer Organization:

- Deals with **structural relationship**.
- Operational attributes are linked together and contribute to realize the architectural specification.

In CO, functional units collectively work together in order to execute Computer Instructions.

Designing is the attribute of CA and Utilization is attribute of CO.

Computer Functional Units:

Generic computer is comprised of various functional units.

Processor: Collection of Register section and arithmetic and logic unit aka ALU and a timing and control unit, along with these it also has another section "Interface".

Memory: It stores all the instructions reading ways the processor works accordingly, we can store data in memory.

I/O Peripherals: Peripherals is another word for device. Either they provide the output or store it in memory.

System Bus: Connections happens using this.
